

ABSTRACT OF THE DISCLOSURE

A sulky to be drawn by a horse is provided that removes or lessens many problems with conventional sulkies including providing a means to align the wheels to ensure that they are aligned with the direction the horse is pulling the sulky, a novel wheel assembly with substantially planar wheel covers, a novel means of allowing the horse and the sulky to track independently of each other, and a novel means of offsetting the center line of the sulky from the center of the horse.
